## S1 Vibration artefacts

Early on in this project, we have determined experimentally that vibration artifacts were still present under the motion of motors, even if the sample were not moving and staying at the high field position, with the cord disconnected from the sample and no pressure applied (see Figure below). These spectra are shown as supporting information.

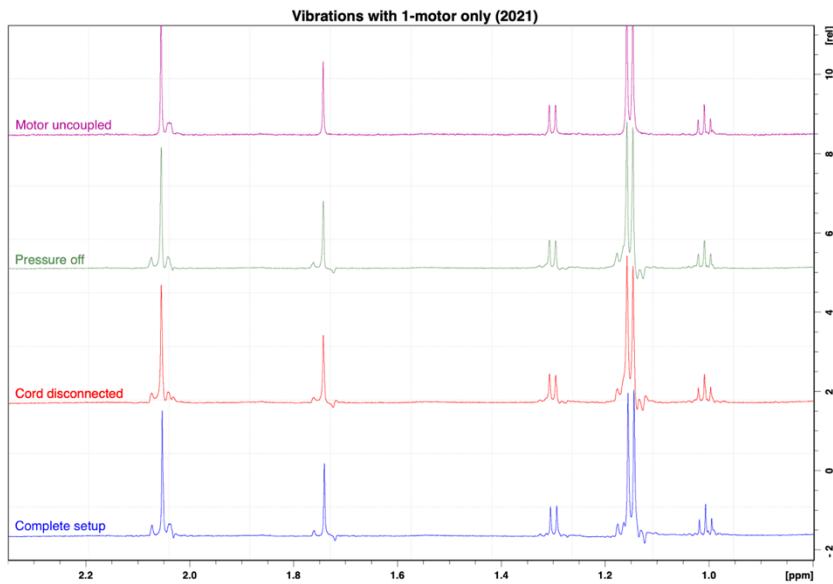

Figure S1.  $^1\text{H}$  NMR spectra of glucosamine showing mechanical vibration artifacts. (blue) FSS setup with one single motor, it defines the vibration's baseline. (red) The cord is disconnected from the winch wheel and the sample is resting at the high-field position, with pressure and motor still active. (green) Pressure is turned off and transfer station removed, leaving only the motor active. (purple) The motor is uncoupled from the supporting structure: no vibrations are transferred anymore.

## S2 Example of pulse program

Below, we give the pulse program used on the Bruker spectrometer to record  $^{13}\text{C}$  longitudinal relaxation rates in methyl groups. The commands specific to the use of the shuttle are shown in bold.

```
;Pulse program for High Resolution Relaxometry R1 of methyl carbons in 13CHD2 groups
;For proteins only 13C labeled in methyl groups
;Last change 3/05/2024 LS PHP - remove 13C eq polarisation
;updated to new shuttle, with 2H decoupling, gradients in sensitivity enhancement block
;with decoupling during acquisition
;using f2 - channel for 13C and f4 - channel for 2H
;
